

Creative Workflow Builder

A standalone HTML prototype for capturing a creative idea, mapping tools and references, and exporting the resulting workflow as a visual artifact.

Archive transfer note

Prototype interface preview

1. Source request

The conversation began with a need to turn a creative process into a portable, visual workflow.

ORIGINAL INTENT

“I can input information about my creative workflow: an overall idea, the tools I am using, and image references or inspiration. Then, when I click Go, generate a visual workflow that can also be downloaded.”

Design translation: move from raw creative notes to a structured, sharable map without requiring a backend, account, or design software.

CORE PROBLEM

- Creative workflows are usually scattered across notes, tools, screenshots, prompts, and references.
- The archive needs both the final result and the process logic behind it.
- The output should be legible to another person without access to this chat.

Prototype outcome: a single HTML file that collects inputs and turns them into an exportable workflow diagram.

2. Concept in one sentence

A lightweight translator from creative intent to visual process documentation.

The artifact is intentionally “small enough to move”: it can be emailed, archived, opened locally, and understood without a custom software environment.

3. User flow

The builder separates the creative process into a clear capture → generate → export loop.

4. Prototype interface

Capture fields are organized around project title, core idea, tools, and references.

INTERFACE BEHAVIOR

- Textarea for the central creative idea.
- Repeatable tool fields for naming each step, method, or system.
- Reference fields for inspirations, links, source notes, and image cues.
- Action buttons for Go, sample load, clear, JSON save/import, and SVG/PNG download.

The form frames workflow capture as a repeatable studio practice rather than a one-off prompt.

5. Generated workflow

The Creation converts the captured information into a visual map that can be saved outside the tool.

OUTPUT LOGIC

- Starts with the idea as the organizing node.
- Places tools as process components in the chain.
- Surfaces references as a contextual layer rather than hidden notes.
- Exports the visualization as SVG or PNG for slides and archival systems.

Archive value: process becomes visible, portable, and reviewable.

6. Implemented feature set

The first pass favors portability, transparency, and immediate use.

Standalone HTML

Runs locally in a browser; no installation, backend, or account flow required.

Structured inputs

Core idea, project title, tools, and references are captured in separate fields.

Dynamic fields

Tool and reference sections can grow with the complexity of the workflow.

Export options

Generated map can be downloaded as SVG or PNG.

Data handoff

JSON save/import supports re-opening or transferring the same workflow later.

Local continuity

Autosave keeps work in progress available in the same browser.

7. Transferable project description

Language that can travel with the archived artifact.

This prototype explores how a creative workflow can be captured as a lightweight, editable input form and converted into a visual process map. The goal is to let creative practitioners document not only what they made, but how they moved from idea to tools and references to outcome. The artifact is intentionally portable: a single HTML file that can run locally, generate a diagram, and export that diagram for slides, reviews, or archive records.

Recommended archive framing: process-capture tool, visual workflow generator, standalone browser prototype.

Associated artifact: creative_workflow_builder.html

8. Handoff notes

What the archive receiver should know when opening or extending the work.

ARCHIVE METADATA

Status	Functional prototype / first-pass design artifact
File type	Single standalone HTML file with embedded CSS and JavaScript
Runtime	Modern web browser; no server dependency
Primary output	Downloadable workflow visualization as SVG or PNG

POSSIBLE NEXT ITERATION

- Add richer workflow templates or layout styles.
- Support reference thumbnails or drag-and-drop image cards.
- Allow drag-to-reorder tools and references.
- Create a gallery mode for multiple workflows in one project.
- Add export metadata for creator, date, tools, and project phase.

The prototype should be archived with the HTML file and screenshots so the intent remains visible even if the browser environment changes.

Transfer package

Recommended contents for archiving and review

- 01

creative_workflow_builder.html
Standalone prototype
- 02

Creative_Workflow_Builder_Transfer_Deck.pptx
Narrative deck
- 03

README_archive_note.md
Plain-language project note
- 04

workflow screenshots
Visual record of interface and output

End state: a creative process map that can live beside the work itself.

Sora 2 Prompt Assistant

Single-file HTML prompt builder + archival handoff packet

Packet contents

- slides / archive deck
- html / working prototype
- README.md / handoff notes

Creative Lab Archive

2026-05-25

Designed to turn structured
creative decisions into paste-
ready Sora prompts.

Problem and objective

Problem

Sora prompt writing is easy to under-specify. Creators may forget camera language, lighting, motion beats, sound, or style constraints, especially while iterating quickly.

- Reduce omissions
- Accelerate ideation
- Preserve prompt iterations
- Make prompts paste-ready for the Sora 2 web app

Objective

Build a guided, bilingual, self-contained interface that helps users assemble structured prompts, edit the result, preserve versions, and export settings for archival handoff.

- No installation
- No external dependencies
- Client-side workflow
- Archive-friendly outputs

Final interface architecture

LEFT: scrollable menus

- Scene and subject fields
- Toggles for optional sections
- Dropdown selectors and suggestions
- Image palette extractor
- Workflow controls

Generate → Edit → Save

RIGHT: prompt workspace

- Current prompt fixed at top
- Editable prompt textarea
- Copy / save / export actions
- Numbered generated versions
- History download and cleanup

Prompt model encoded in the builder

1

Scene

world, location, key moment

2

Subject

identity, wardrobe, behavior

3

Cinematography

shot, lens, movement, framing

4

Style + palette

art direction and color codes

5

Lighting

source, contrast, time of day

6

Mood + pace

emotional direction and rhythm

7

Action beats

sequential movement for video

8-10

Dialogue / sound / constraints

optional production details

Core creative workflow

Image palette extraction for Style

Input

Local image upload or image URL. Local files are reliable; remote URLs may be limited by browser CORS.

Extract

Canvas analysis downsamples the image, groups color buckets, and selects five dominant / visually distinct colors.

Apply

The tool displays preview swatches, hex codes, approximate shares, and one-click insertion into the 4) Style palette field.

#102A43 #7DD3FC #F8E7B9 #7A4E2D
#C084FC

Versioning and archival outputs

Prompt versions

- Current prompt remains fixed at top
- Previous prompt is saved when generating a new one
- Manual edits can be saved as versions
- Each version has Load / Copy / Delete actions

Exports

- CSV: form settings + current prompt
- TXT: full current prompt + numbered history
- HTML: standalone prototype for reuse
- PPTX: transferable project explanation

```
field,value
setting,"rooftop greenhouse"
paletteField,"#102A43, #7DD3FC"
currentPrompt,"Scene: ..."
```

Bilingual, themeable, and fast to use

FR / EN

Interface labels, placeholders, prompt section titles, and suggestion banks support French and English workflows.

Dark / Light

Theme toggle supports different presentation or working contexts and is stored in the browser.

Shortcuts

Ctrl + Enter generates; Ctrl + Shift + C copies; Ctrl + Shift + E exports CSV.

Ctrl ↑ E → CSV

Implementation notes

- Single HTML file: HTML + CSS + JavaScript in one portable artifact
- No external dependencies; can run locally after unzipping
- All prompt generation and palette extraction happen client-side
- localStorage preserves theme, language, and saved prompt versions
- URL image palette extraction depends on browser security / CORS
- Suggestion libraries and dropdown options are editable inside the script

```
sora_prompt_builder.html  
├── <style> interface layout, themes, two-panel UI  
└── <script> i18n, prompt builder, versions, CSV, palette extraction
```

Handoff checklist and next iterations

Handoff checklist

- Open HTML locally and test Generate / Copy / CSV
- Validate FR terminology for the team
- Customize suggestion banks for studio vocabulary
- Archive the ZIP with this deck and README
- Keep the Sora guide alongside the packet if needed

Possible next steps

- Add full session JSON import/export
- Add prompt quality scoring / checklist
- Add Creative Lab preset libraries
- Add compact prompt mode
- Add visual thumbnails for prompt versions
